CLAIMS:

We claim:

- 1. An autonomic request routing policy selection system comprising:
 - a plurality of pre-configured request routing policies:
- a data store of cache metrics for said pre-configured request routing policies; and,

a routing policy selector configured for communicative linkage to a server cluster comprising a plurality of servers and programmed to select a particular one of said request routing policies for use in routing content requests in said server cluster based upon said cache metrics, said routing policy selector further comprising a coupling to said routing policies and said data store of cache metrics.

- 2. The system of claim 1, wherein said pre-configured request routing policies comprise a Layer 4 request routing policy and a Layer 7 request routing policy.
- 3. The system of claim 2, wherein said Layer 4 request routing policy comprises a server load balancing type policy.
- 4. The system of claim 2, wherein said Layer 7 request routing policy comprises a content localizing type policy.
- 5. The system of claim 4, wherein said content localizing type policy comprises a uniform resource locator (URL) hashing policy.

- 6. The system of claim 1, wherein said cache metrics comprises a plurality of Zipf-like analyses based upon different selected alpha values for different workloads imposed upon said server cluster according to different ones of said request routing policies.
- 7. An autonomic request routing policy selection method comprising the steps of: identifying a contemporary trace footprint experienced by a coupled server cluster;

identifying a cache allocation for said coupled server cluster;

retrieving at least two sets of hit rate metrics, each set of metrics corresponding to a particular routing policy;

comparing said hit rate metrics based upon said identified trace footprint and said identified cache allocation to determine a preferred routing policy; and,

selecting said preferred routing policy for use in routing content requests to said server cluster.

8. The method of claim 7, further comprising the steps of:

computing with said hit rate metrics, an optimal server cluster configuration for said preferred routing policy; and,

provisioning an optimal number of servers in said server cluster based upon said computed optimal server cluster configuration.

- 9. The method of claim 7, wherein said selecting step comprises the step of selecting a server load balancing type routing policy when said identified cache allocation approaches in value said identified trace footprint.
- 10. The method of claim 7, wherein said selecting step comprises the step of selecting a content localizing type routing policy when either said identified cache allocation is small, or when said trace footprint is large.
- 11. A machine readable storage having stored thereon a computer program for autonomic request routing policy selection, the computer program comprising a routine set of instructions which when executed by the machine cause the machine to perform the steps of:

identifying a contemporary trace footprint experienced by a coupled server cluster;

identifying a cache allocation for said coupled server cluster;

retrieving at least two sets of hit rate metrics, each set of metrics corresponding to a particular routing policy;

comparing said hit rate metrics based upon said identified trace footprint and said identified cache allocation to determine a preferred routing policy; and,

selecting said preferred routing policy for use in routing content requests to said server cluster.

12. The machine readable storage of claim 11, further comprising the steps of:

computing with said hit rate metrics, an optimal server cluster configuration for said preferred routing policy; and,

provisioning an optimal number of servers in said server cluster based upon said computed optimal server cluster configuration.

- 13. The machine readable storage of claim 11, wherein said selecting step comprises the step of selecting a server load balancing type routing policy when said identified cache allocation approaches in value said identified trace footprint.
- 14. The machine readable storage of claim 11,, wherein said selecting step comprises the step of selecting a content localizing type routing policy when either said identified cache allocation is small, or when said trace footprint is large.
